

Incorporating Private Debt into Bond Portfolios

In the current low yield and low return environment, investors are searching for opportunities to enhance the performance and diversification of fixed income portfolios. As a result, many are turning towards private debt to achieve these goals.

Fixed income portfolio returns are largely driven by three factors: duration premium, credit premium and private premium. While duration and credit premiums can be accessed through traditional fixed income securities, such as government and corporate bonds, private premiums are attained by investing in private debt, which is generally not traded daily in public markets. Investors in private markets demand a higher premium for equal levels of risk given infrequent trading, complexity of access and lower levels of competing capital. This additional yield is the private debt premium over duration and credit.

Types of Private Debt

Private debt comes in several forms, including infrastructure debt, mezzanine debt, leveraged loans, direct corporate lending and real estate debt. Although each type provides investors with some exposure to the private premium, other yield factors also tend to

be embedded in private debt premiums, resulting in exposure to duration and credit risk. By breaking down the premiums generated by different types of private debt, it is possible to understand the yield factors associated with each type and the respective risk and return profiles:

Figure 1: Harvesting Illiquidity Premiums

Type	Yield Factor	+Private Premium
Infrastructure Debt	Long Credit	✓
Mezzanine	Short Credit/ High Yield	✓
Direct Lending	Investment Grade/ High Yield	✓
Real Estate Debt	Investment Grade/ High Yield	✓

Source: Greystone.

For instance, given the long-term nature of infrastructure assets, a significant component of the yield is achieved through duration and credit as opposed to the private premium. Given the importance of matching a plan's duration profile to its cash flow requirements, infrastructure debt tends to be compelling for defined benefit plans that typically have long-dated liabilities.

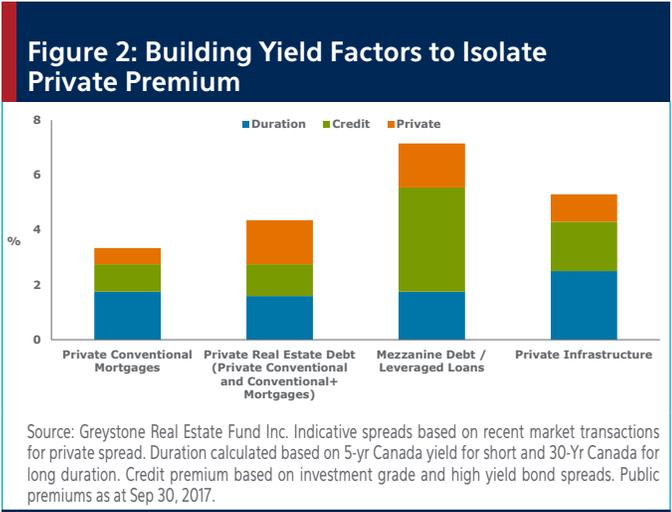

Mezzanine debt and leveraged loans also offer attractive yields; however, a significant component of the yield is achieved through lower quality (i.e. high yield) credit. Typically, this type of credit exposure can also be accessed through traditional high yield bonds, which generally provide a higher level of liquidity than private debt.

the private real estate debt market to consist of only private conventional mortgages, private real estate debt can in fact be divided into two components:

1. Private Conventional Mortgages
2. Private Conventional Plus Mortgages

Private Conventional Mortgages are typically longer-term loans with a first charge on a property that is occupied by a tenant base and is generating a stabilized income stream (i.e. office, retail, industrial and multi-unit residential). Private Conventional Plus Mortgages are loans on real estate at earlier stages of the real estate life cycle, before the property reaches stabilization. Conventional Plus loans generally include land, land servicing, construction and interim/bridge financing for lease-up periods. These types of loans are generally shorter term, floating rate loans with lower loan to value ratios and greater recourse to the borrower to reduce the risk profile.

The supply of capital for these shorter term loans tends to be lower than for Conventional loans, which allows lenders who participate in this space to command higher spreads. The underwriting process for Conventional Plus loans is more complex and requires a deeper understanding of the underlying real estate in order to ensure that risk-adjusted returns are being maximized.

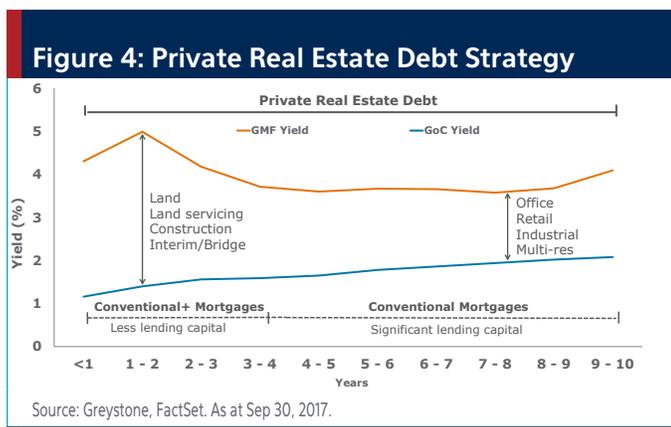

The real estate debt market provides an interesting case study on the different levels of private premiums available within a single asset type. While many investors consider

Real estate debt strategies that access all segments of the real estate debt market and invest in different loan types (i.e. Conventional and Conventional Plus) can therefore provide an attractive yield to investors, which is in line with other types of private debt. This is reflected in Figure 4, which compares the yield curve of the Greystone Mortgage Fund (“GMF”) to the Government of Canada (“GoC”) yield curve.

Conventional Plus loans may be associated with a higher risk segment of the real estate debt market. However, comparing historical loss rate data of investment grade corporate bonds to our mortgage strategy reveals loss rates from credit events in line with investment grade corporate strategies. We believe that an ability to underwrite with strong covenants can result in high-quality exposure within Conventional Plus sectors.

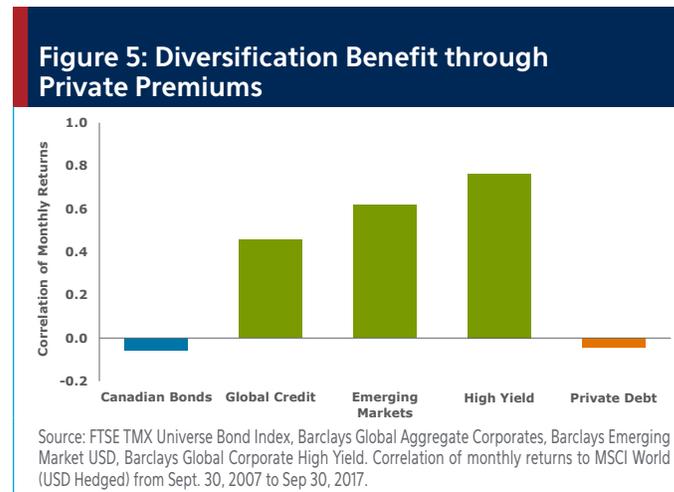

Core Plus Bond Strategies: Integrating Private Premiums with Traditional Fixed Income Portfolios

Core Plus Bond Strategies retain the FTSE TMX Canada Universe Bond Index while incorporating investment opportunities found outside the benchmark to enhance yield. These strategies hedge back all external risks, such as interest rate and currency, when opportunities are sourced globally. We believe that using private premiums as the lever for enhancing returns against a universe bond benchmark is a highly compelling opportunity when compared to using global or high yield bonds. In fact, by integrating private debt, such as commercial mortgages, into a fixed income

portfolio, investors can enhance their yield experience across the maturity spectrum while maintaining a desired duration level (i.e. short-term, universe bonds or long-term bonds). The Greystone Bond Plus Fund, which is currently allocating a 25% weight to private real estate debt through the Greystone Mortgage Fund, has generated a 50 basis point yield pick up relative to Greystone’s Core Fixed Income Strategy since its inception in July 2014.

In addition, while traditional higher yielding fixed income assets that are typically used in Core Plus Strategies (i.e. high yield bonds, global bonds and emerging market debt) tend to have a positive correlation to equity returns, private debt tends to be negatively correlated to equities, thereby enhancing the diversification and reducing the volatility of a balanced portfolio.

Summary

Private debt continues to offer a compelling source of risk-adjusted returns. Private premiums tend to be less correlated with traditional public market securities and integrating them into a traditional fixed income portfolio can enhance the overall yield premium across a desired duration profile.

Greystone Managed Investments Inc.

With over \$33 billion in assets under management,¹ we proudly serve universities, pension funds, multi-employer groups, endowments & foundations, insurance companies, and non-profit organizations.

We are a private company, majority-owned by our employees — over 90% of eligible employees are shareholders.²

Greystone has in-house expertise in the following areas:

MULTI-ASSET

- Balanced
- Balanced Plus
- Target Date Plus
- Alternative Suite

FIXED INCOME

- Short-Term, Universe, Long-Term
- Corporate, High Yield
- Bond Plus
- Liability Driven Investing

REAL ASSETS

- Real Estate
- Infrastructure

PRIVATE DEBT

- Mortgages

PUBLIC EQUITIES

- Income & Growth
- Canadian, U.S., Global, International, China
- Canadian Small Cap
